(54) Title: RADIO SYSTEM WITH CONFIGURABLE LINKS

(57) Abstract: A system comprising radio devices (10a, 10b), and methods of configuring radio links between said devices, is described. The devices are physically attachable/detachable from a host apparatus (12a, 12b). The device provides a host apparatus with a radio link (20) to another host apparatus also containing an appropriately configured device. To configure the links, a consumer merely brings the devices into close proximity for a few seconds. Proximity detection means (38) in the devices detect said proximity and begin an automatic registration process to configure a link therebetween. Links may be cancelled by repeating the process. Hence a consumer friendly, flexible radio configuration scheme is provided enabling simple configuration of one-to-one or one-to-many links, with the e-buttons offering a physical reminder to the user of which apparatus has wireless capability.
